

# Monitoring Applications in AWS with X-Ray and CloudWatch

---

**Ryan Lewis**

CLOUD ENGINEER

@ryanmurakami ryanlewis.dev

X-Ray monitoring is  
great for troubleshooting

# Overview

**A bird's eye view of X-Ray**

**Traces are everywhere**

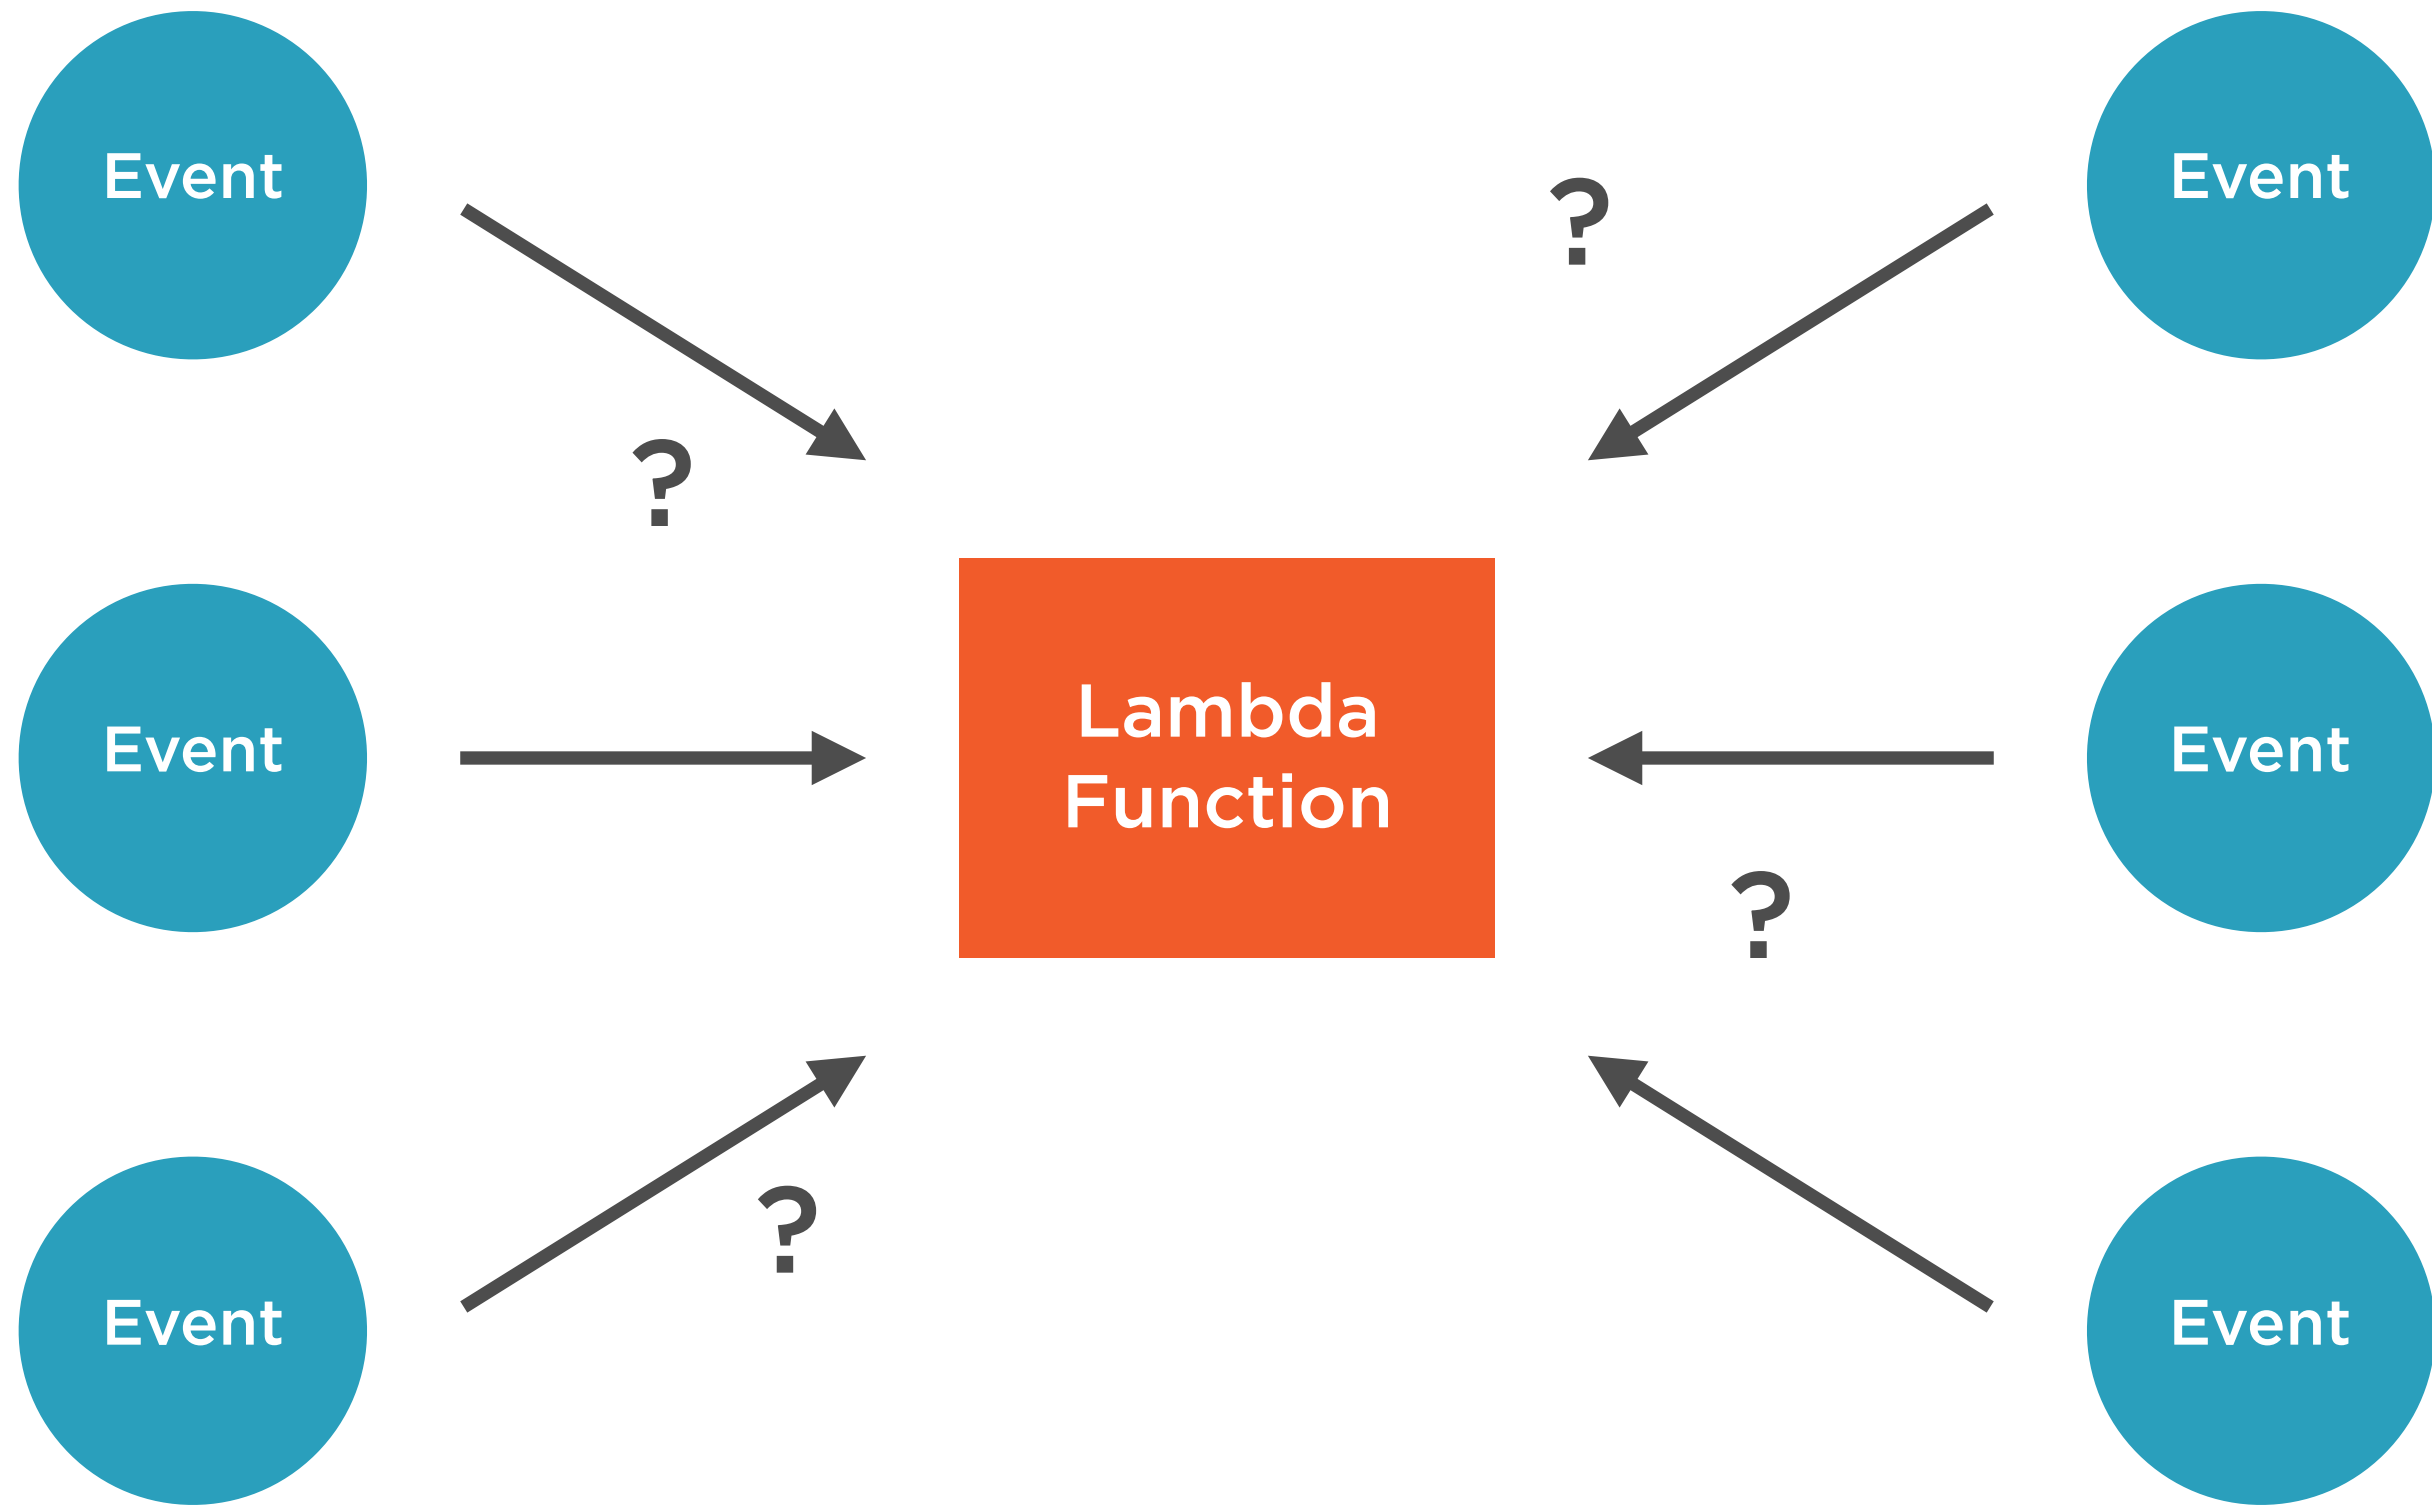

**X-Raying a Serverless application**

**Don't be alarmed by CloudWatch**

**Clean it up and go home**

# How X-Ray Works

---

# Ways to Improve AWS Application Insight

**Aggregate logs to a common place**

**Use X-Ray to monitor applications**

# AWS X-Ray

The diagram illustrates the AWS X-Ray architecture. It features three main components arranged horizontally: a dark gray square on the left labeled 'X-Ray Service', a central orange circle labeled 'X-Ray Data', and a maroon square on the right labeled 'Your Application'. The 'X-Ray Data' circle is positioned between the 'X-Ray Service' and 'Your Application' squares, indicating its role as the central data repository for the application's traces.

**X-Ray  
Service**

**X-Ray  
Data**

**Your  
Application**

# X-Ray Data Contents

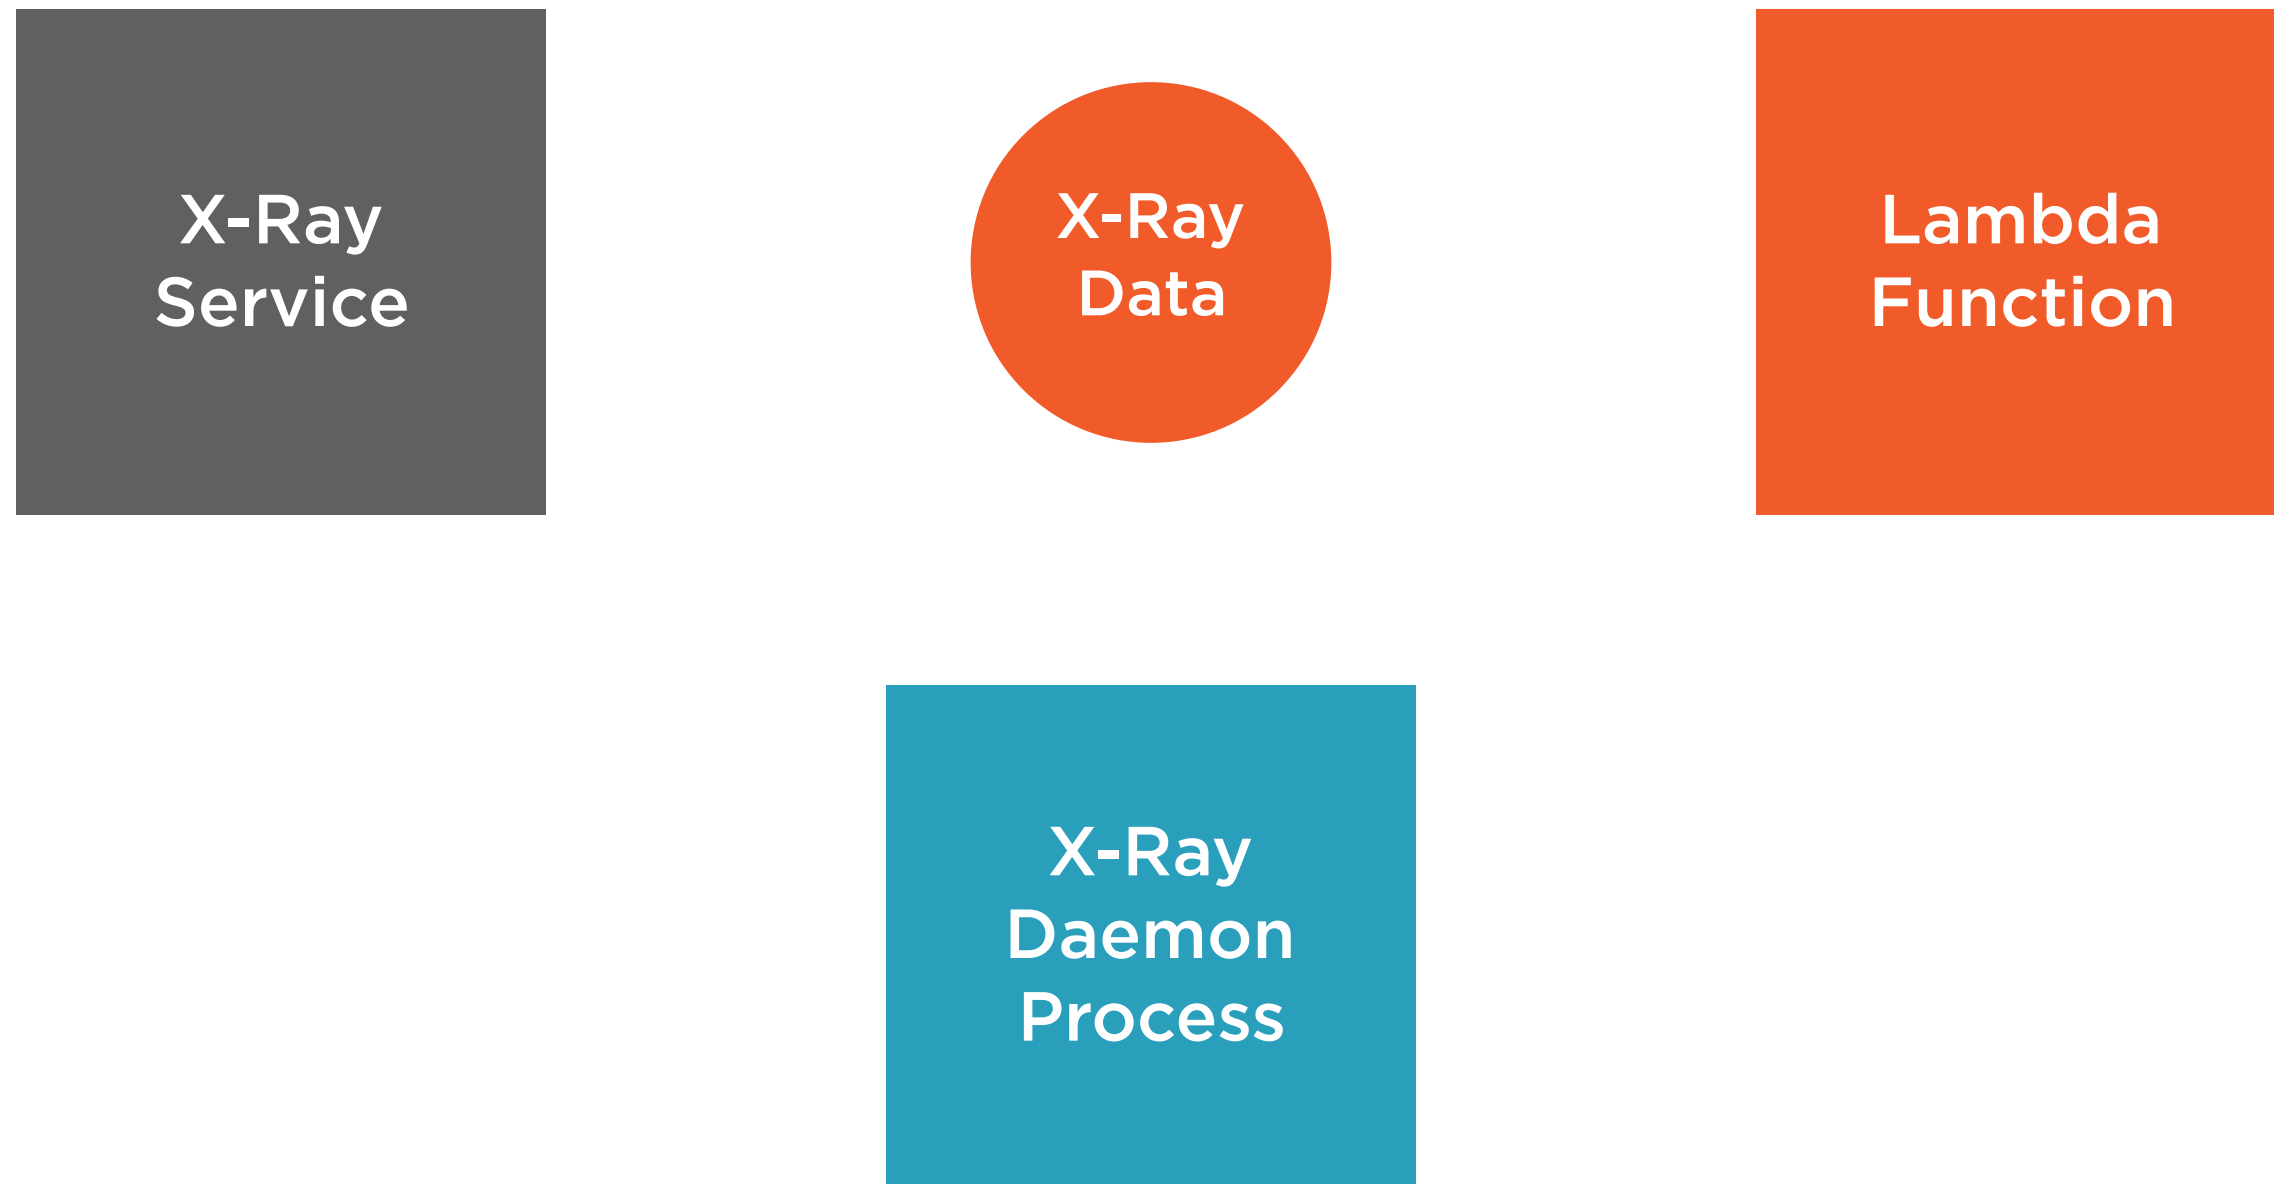

**Trace ID**

**Trace Data**

# AWS X-Ray

X-Ray daemon is pre-  
installed for Lambda and  
Elastic Beanstalk

# X-Ray Sampling Default Rules

1 request/second

5% of subsequent requests

# Tracing in AWS X-Ray

---

# X-Ray Trace

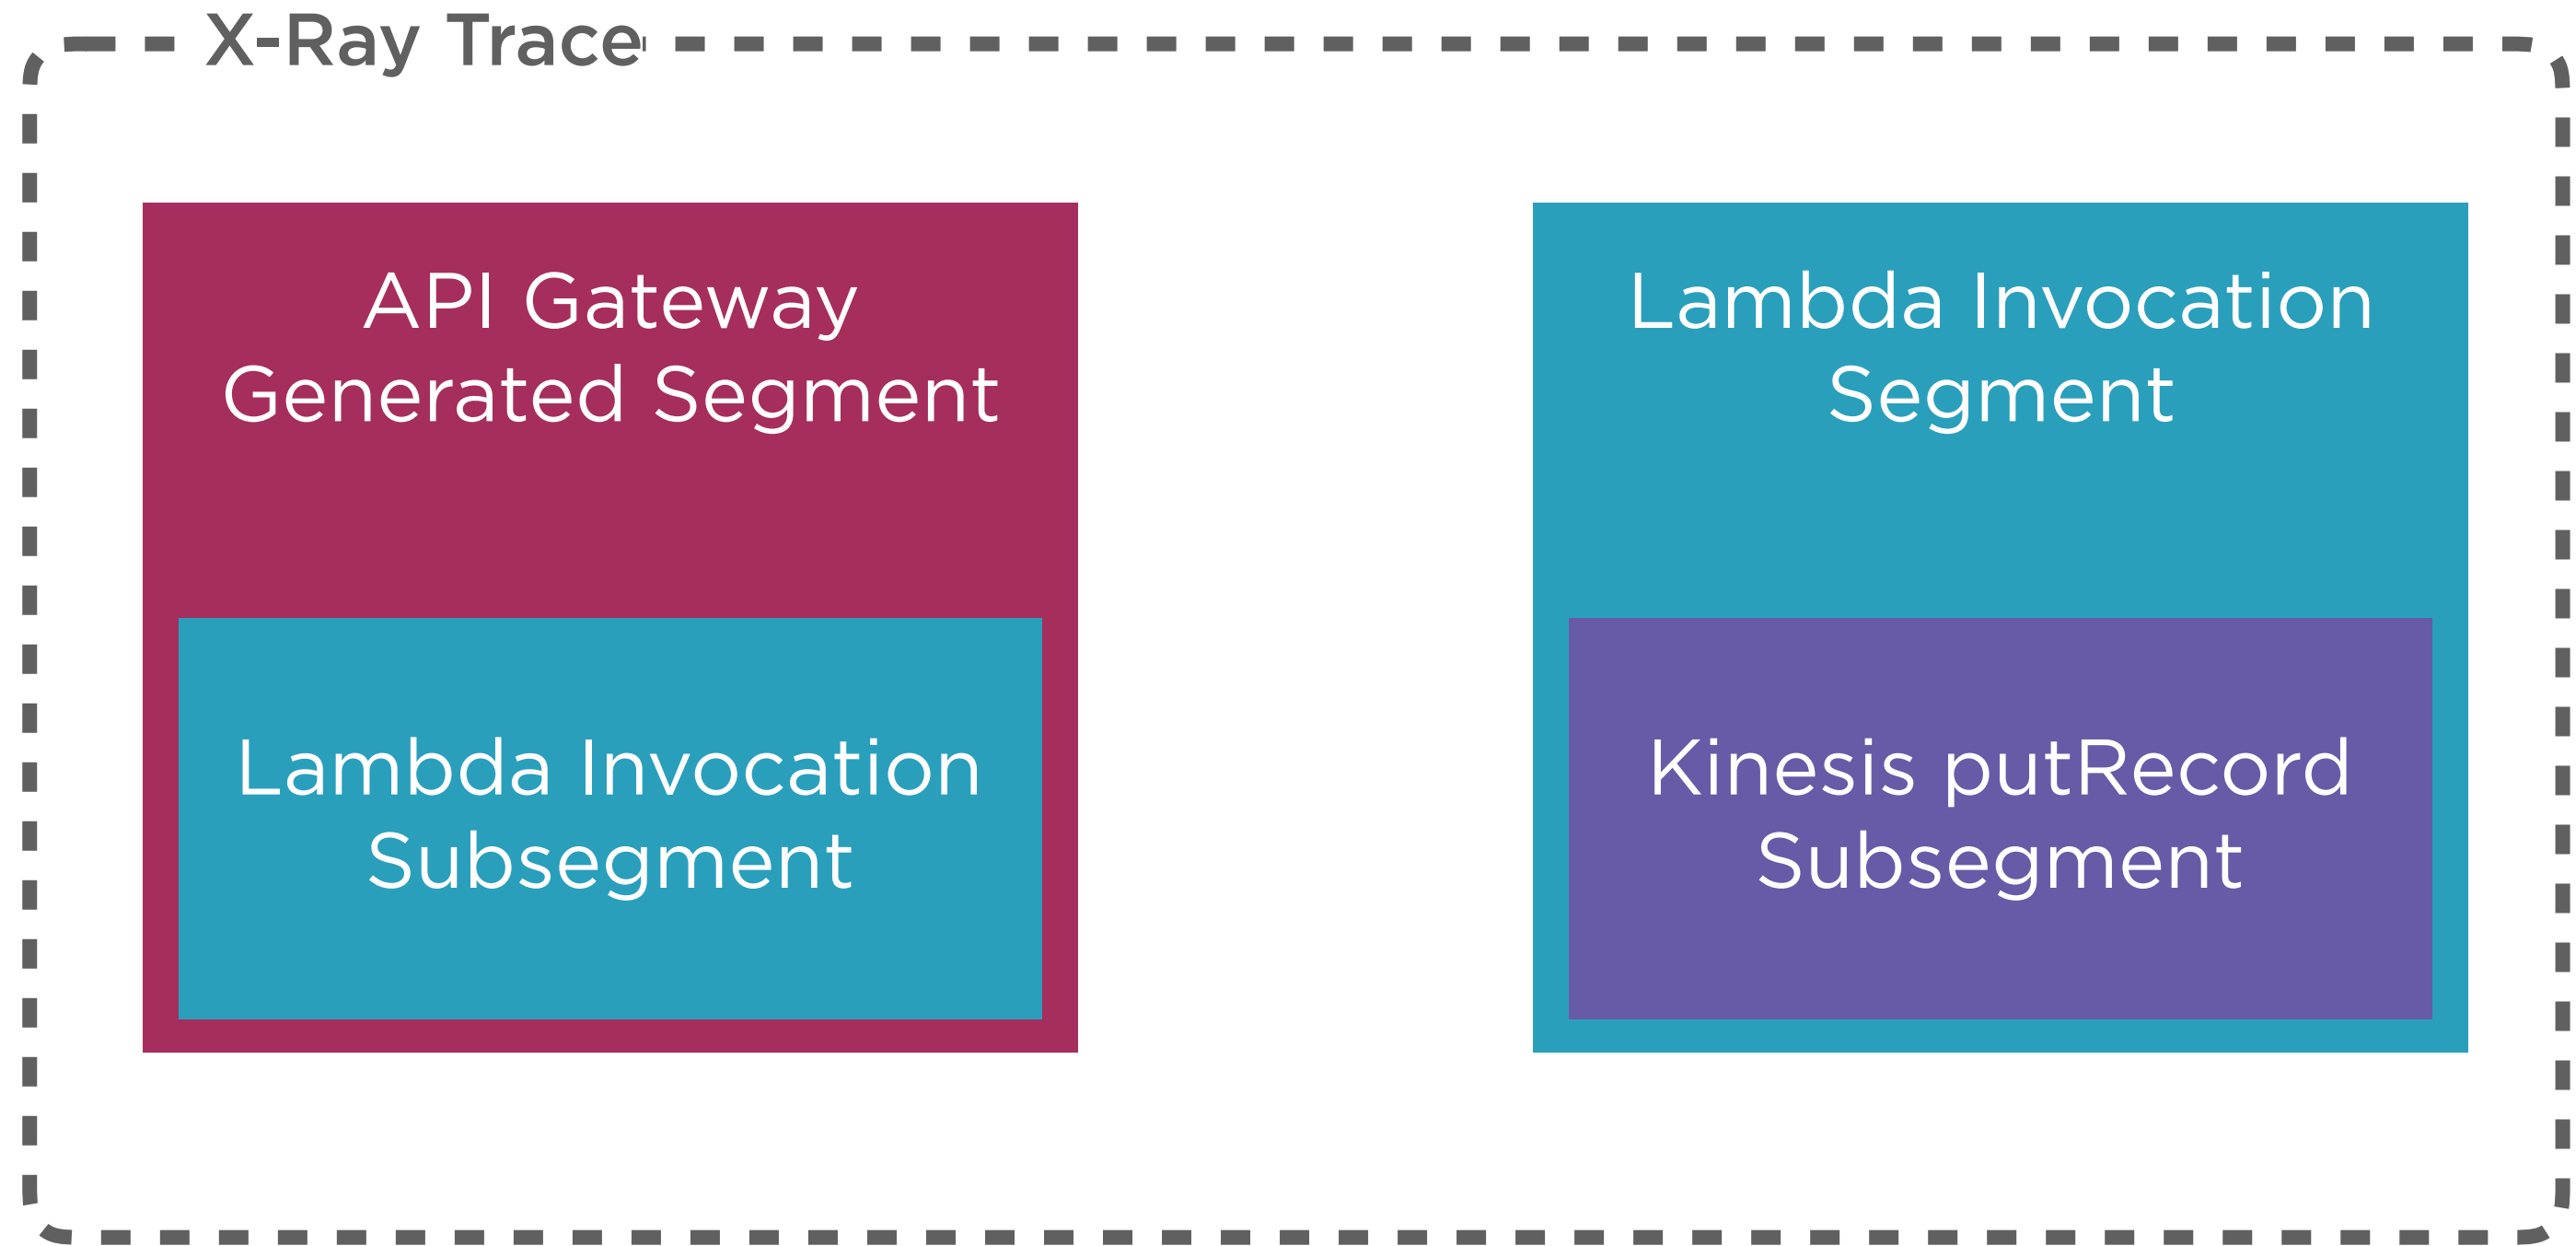

Representation of the actions taken in response to a single request to your application.

The first X-Ray enabled service in your application that receives a request will generate a **Trace ID**

# X-Ray Segment

A single packet of data describing an action that took place in response to a request. Contains a Trace ID.

# X-Ray Segments and Subsegments

# X-Ray Instrumented Code

```
const AWSXRay = require('aws-xray-sdk')

const segment = new AWSXRay.Segment('my-segment')
AWSXRay.setSegment(segment)

// complicated code

segment.addMetadata('result', codeResult)
segment.close()
```

# Monitoring Serverless Applications with X-Ray

---

# Configuring an Application for X-Ray

**Enabling  
X-Ray tracing  
for services**

**Instrumenting  
application  
code with  
X-Ray SDK**

# Monitoring Serverless Applications with CloudWatch

---

CloudWatch Alarms can invoke  
Lambda functions when triggered

If one Lambda fails in a Serverless application, does it make a sound?

# Removing Demo Application Resources

---

# Conclusion

---

# Summary

**A diagram for X-Ray**

**Tracing between API Gateway and Lambda**

**A watchman for our Lambda errors**

**Saved by the Serverless removal script**

# Thank you!
